Description

Loop-IP6700 TDMoEthernet is used to transport TDM traffic over IP network, in addition to Ethernet traffic. As the core communications network migrates from TDM to IP, the Loop-IP6700 provides a flexible and cost effective choice for the transport of legacy TDM signals.

On the WAN side, the Ethernet interface can be 10/100M electric or optical Ethernet. On the tributary side, the TDM ports can be multiple E1, T1, and DTE, or single E3/DS3, each with timing preserved. The Ethernet port can be 10/100 BaseT.

The Loop-IP6700 has built-in AC or DC power. Management choices include console port, Ethernet port, and SNMP port, in addition to Inband management for communication with remote management centers.

For transport of TDM signals E1, T1, E3, DS3, Jitter and Wander adheres to G.823 Traffic and G.823 Synchronous.
